Close faster, recover more

AI-powered CTV revenue reconciliation for Apex Exchange

Prepared for: CFO / VP Revenue Accounting · Director of Billing Operations · VP Data Engineering

1 · The headline

$27.4M of Q3 CTV revenue is in dispute with DSPs. About $14.9M of it is recoverable, and today it takes 3 weeks per case to get it.

The Reconciliation Copilot finds every discrepancy the day the partner file lands, tells Billing Ops *why* it happened, drafts the dispute, and tracks it to cash, all on one governed platform.

What changes	Today	With the Copilot
Root cause right on first look	69% (analyst playbook)	**95%** (model, Jul–Sep out-of-time test)
Time to resolve a dispute	21 days avg · 34 days p90	**Target ≤ 7 days**
Cases worth chasing, identified up front	Not separated	**273 cases / $6.2M flagged as no-recovery** (timezone, IVT)
Partner files with bad rows caught before billing	Found in spreadsheets, if at all	**1,725 rows quarantined automatically, with the reason**

2 · Why this matters to Apex

- Apex sits in the middle of the money: **DSPs pay Apex, and Apex pays publishers** (~84% of revenue; Apex keeps a ~16% take rate). When a DSP pays on a lower count than Apex owes the publisher, **Apex eats the difference**.
- Q3 2026: **$428M gross CTV revenue; $32.8M (7.6%) not matched by DSP reports.**
- 955 deal-months across **38 of 40 DSPs** needed review in Q3, about 360 new disputes every month.
- Disputed invoices sit unpaid. At ~$300K of disputed revenue a day, every day of resolution time is working capital locked up.

3 · Why CTV discrepancies happen (and why spreadsheets can’t keep up)

Three systems count the same impression: **Apex’s auction logs**, the **DSP’s billing report**, and the **publisher’s ad server**.

Root cause	What happens in CTV	Recoverable?	Q3 exposure
SSAI beacon loss	Server-side ad insertion beacons don’t fire at peak load and on live events	Partly (40%)	$5.7M
IVT filtering	DSP’s fraud vendor removes spoofed CTV devices	Credit if verified	$4.8M
Late / missing data	Report days never arrive	Yes (90%)	$4.7M
Deal-ID mis-mapping	DSP books delivery under the wrong deal	Yes (95%)	$4.5M
Genuine billing error	Unexplained under-reporting	Mostly (60%)	$4.3M
FX mismatch	EUR/GBP partners convert at the wrong rate	Yes (90%)	$1.7M
Timezone shift	Partner reports in ET/PT; primetime crosses midnight UTC	No: reporting fix only	$1.4M

Recovery rates are Billing Ops’ actual Jan–Jun 2026 outcomes on resolved cases. Real cases are often mixed (e.g. SSAI loss plus some IVT); the model names the main cause.

4 · Today vs. tomorrow

Today: download 40 partner portals' files in 3 formats → VLOOKUPs → email back and forth → guess the cause → write off what's left.

Tomorrow: 1. Partner files are ingested and validated automatically (Lakeflow). 2. Every deal is reconciled daily and monthly against Apex logs. 3. A model explains *why* each gap happened, and a draft dispute is ready (AI). 4. Analysts work one prioritized queue and resolve in one click (Databricks App + Lakebase). 5. Finance asks questions in plain English (Genie).

5 · The Reconciliation Workbench (what the analyst sees)

- **Close overview:** September: Apex $146.8M vs DSP-reported $137.5M, **$10.26M at risk**, 276 cases open, recovered-to-date counter.
- **Triage queue:** sorted by dollars at risk, with model root cause and confidence.
- **Case detail:** e.g. *Willow Demand · Evergreen Movies FAST · Sports PMP, Sept: $347,168 gap (45%) vs a 5% threshold. Model: deal-ID mis-mapping (99.6%): a sibling deal shows the mirror-image surplus.* Daily Apex-vs-DSP chart, evidence tiles, AI case summary, an editable dispute email, and Send / Resolve / Approve credit buttons.
- **Ask Genie:** *"What's our revenue at risk by partner team for September?"* → Pacific $5.28M, Central $1.96M, Atlantic $1.62M, EMEA $1.40M.

6 · Impact on your KPIs

KPI (owner)	Baseline (Q3 2026 data)	Target	Annual value*
Revenue recovered from DSPs (CFO)	Recoverable exposure $14.9M / quarter; team reaches ~60% of cases today*	Pursue 100% of recoverable cases	**≈ $24M / year**
Dispute cycle time / DSO (CFO)	21 days avg	≤ 7 days	**≈ $4.2M cash released** (one-time; ~$300K/day × 14 days faster)
Analyst effort (Billing Ops)	~360 cases/month × ~2.5 h each* ≈ 5.7 FTE	~45 min per case (draft + evidence ready)	**≈ 4 FTE redeployed**
Wasted effort (Billing Ops)	Every flagged case gets chased	29% of queue triaged as no-recovery	273 cases / quarter not chased
Month-end close (CFO)	~10 business days*	~4 days	Faster, auditable close

* Assumptions to validate with Apex in discovery: current coverage (60%), manual effort per case (2.5 h), close length (10 days). All other figures are computed from the build's data.

7 · For the CFO

- **More cash, sooner:** ≈ $24M a year of recoverable revenue that currently goes stale, plus faster collection on disputed invoices.
- **Audit-ready:** every number traces from the partner file to the invoice (Unity Catalog lineage). Every analyst action is logged (who, what, when, model vs final cause).
- **Controls:** revenue figures are visible to Finance only; partner managers see only their own DSPs. Enforced by the platform, not by the app.
- **A forecastable close:** daily reconciliation means no month-end surprise.

8 · For the Director of Billing Operations

- One queue, ranked by dollars, so the team works the right cases first.
- Root cause right on first look 95% of the time, vs 69% with today's rules of thumb, even on mixed-cause cases. Analysts confirm or override, and that feedback retrains the model.
- Dispute emails drafted from the evidence and the contract: 250 drafts, every dollar figure checked against the source, each ask checked against the contract's billing basis (3 flagged for review), rated 4.9/5 for accuracy by an independent AI judge.
- Bad partner files caught on arrival (unknown deals, duplicates, bad dates, negative counts, wrong seat), not at month-end.

9 · How it works: one governed platform

Need	Databricks
Ingest 3 partner formats + SSP logs, validate	**Lakeflow** declarative pipelines, Auto Loader, data-quality expectations
Govern revenue data by partner and role	**Unity Catalog**: row filters, column masks, tags, lineage
Explain the gap, draft the dispute	**ML** (MLflow, model registry) + **GenAI** (`ai_query`, Claude)
Live case workflow	**Lakebase** (Postgres) synced with the lakehouse
Plain-English questions	**Genie**
The analyst's workbench	**Databricks App**

No data leaves the platform, and there's no separate operational database or BI tool to stitch together.

10 · Proof from the build

- 3.54M hourly log rows, 157K DSP report rows and 159K publisher rows ingested, covering 9 months, 40 DSPs, 150 CTV publishers and 800 deals.
- 1,725 bad partner rows quarantined, matching the defects injected into the partner files.
- Root-cause model: macro F1 **0.94** out-of-time vs **0.48** for the current playbook (0.84 vs 0.43 against noisy analyst labels).
- GenAI: 100% of dollar figures grounded; 98.8% contract-consistent; 0 parse failures.
- Genie: **12/12** finance questions answered correctly against independently written reference SQL.
- App: end-to-end test from case open → dispute sent → resolved with credit, written to Lakebase and visible in Genie.

11 · Rollout plan

When	What	Success measure
Days 0–30	Pilot with the **top 5 DSPs (48% of Q3 revenue at risk)** on Apex's real partner files; analysts run the workbench alongside spreadsheets	Root-cause agreement with analysts ≥ 85%
Days 31–60	All 40 DSPs; publisher-side payout reconciliation; on-behalf-of-user access in the app	Cycle time ≤ 10 days
Days 61–90	Retire spreadsheet process; model retraining on analyst-confirmed causes; close on daily reconciliation	Cycle time ≤ 7 days, close ≤ 4 days

12 · Next steps

1. **Discovery session with Billing Ops** to validate the baseline assumptions (coverage, effort per case, close length).
2. **Data access:** one month of Apex auction log extracts + DSP billing files for the top 5 DSPs.
3. **Pilot sponsor:** VP Revenue Accounting; success criteria agreed up front.
4. **Executive readout** at day 30 with recovered dollars and cycle-time results.
